

# Special Discrete Distributions

From Binomial Distribution to Poisson Distribution

# Experiment

success

failure

**Bernoulli trial**

# Bernoulli trial

$p$

$1 - p \equiv q$

$$p(x) = \begin{cases} q, & x = 0 \\ p, & x = 1 \\ 0, & \text{other} \end{cases}$$

# Binomial random variable

$\times n$

All  $p(\text{success})$  **independently**

$$p(x) = P(X = x) = \begin{cases} \binom{n}{x} p^x (1-p)^{n-x}, & \text{if } x = 0, 1, 2, \dots, n \\ 0, & \text{elsewhere} \end{cases}$$

The number of successes  
(A binomial random variable)

# Distribution

$(n, p)$        $(5, 0.5)$

$(10, 0.5)$

$(20, 0.5)$

Small probability

$$n \rightarrow \infty \text{ 、 } p \rightarrow 0 \text{ 、 } np = \lambda(\textit{moderate})$$

Large number of trials

# Poisson random variable

$$\begin{aligned}P(X = i) &= \binom{n}{i} p^i (1 - p)^{n-i} \\&= \frac{n!}{(n-i)! i!} \left(\frac{\lambda}{n}\right)^i \left(1 - \frac{\lambda}{n}\right)^{n-i} \\&= \frac{n(n-1) \cdots (n-i+1)}{n^i} \frac{\lambda^i}{i!} \frac{\left(1 - \frac{\lambda}{n}\right)^n}{\left(1 - \frac{\lambda}{n}\right)^i} \\&\rightarrow \frac{e^{-\lambda} \lambda^i}{i!}\end{aligned}$$

$$\triangleright np = \lambda$$

$$\triangleright \lim_{n \rightarrow \infty} \left(1 - \frac{\lambda}{n}\right)^i = 1$$

$$\triangleright \lim_{n \rightarrow \infty} \left(1 + \frac{x}{n}\right)^n = e^x$$

$$\triangleright \lim_{n \rightarrow \infty} \left(1 - \frac{\lambda}{n}\right)^n = e^{-\lambda}$$

# Good

- $p < 0.1$  and  $np < 10$
- If  $np > 10 \Rightarrow$  normal distribution

# Example: the number of incoming calls

What is the probability of receiving 2 calls in the next hour?

$$\lambda = 4$$

$$P(X = i) = \frac{e^{-\lambda} \lambda^i}{i!}$$

$$P(X = 2) = \frac{e^{-4} 4^2}{2!} \approx 0.1465$$

4 calls per hour

Ans: 14.65%

# Example: the radioactive decay of elements

Every gram of this element, on average  
Emits **3.9  $\alpha$  particle per second**

What is the probability that during the next second the number of alpha particles emitted from 1 gram is

- (a) At most 6;
- (b) At least 2;
- (c) At least 3 and at most 6?

# Solution

Large  $n$     Emit an alpha particle during the next second(success)

$X$ , the number of alpha particle emitted during the next second

$$E(X) = 3.9, np = 3.9, p = 3.9/n$$

$$\lambda = 3.9 \Rightarrow P(X = n) = \frac{e^{-3.9}(3.9)^n}{n!}$$

# Solution

$$(a) P(X \leq 6) = \sum_{n=0}^6 \frac{e^{-3.9}(3.9)^n}{n!} \approx 0.899$$

$$(b) P(X \geq 2) = 1 - P(X = 0) - P(X = 1) = 0.901$$

$$(c) P(3 \leq X \leq 6) = \sum_{n=3}^6 \frac{e^{-3.9}(3.9)^n}{n!} \approx 0.646$$

# Poisson process

1. **Stationarity:** The average rate of occurrence is **constant** over time.
2. **Independent Increment:** Each event occurs **independently** of the others.
3. **Orderliness:** Two events cannot occur at exactly the same instant.

# Appendix

	$E(X)$	$Var(X)$	$\sigma_x$
Binomial	$np$	$np(1 - p)$	$\sqrt{np(1 - p)}$
Poisson	$\lambda$	$\lambda$	$\sqrt{\lambda}$
